arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved. NOTE: This is a 'working draft' sequence. It currently consists of 9 contigs. The true order of the pieces is not known and their order in this sequence record is s: contig of 41283 bp in length s: gap of unknown length s: contig of 36297 bp in length s: contig of 34138 bp in length s: contig of 34138 bp in length s: gap of unknown length s: contig of 16184 bp in length s: gap of unknown length s: contig of 14239 bp in length s: contig of 4239 bp in length s: contig of 8257 bp in length 811 others gap of unknown length contig of 6447 bp in length contig of 1045 bp in length. gap of unknown length 52170 a 36385 c 35342 g 50444 t /organism="Homo sapiens" /db_xref="taxon:9606" clone="RP11-490H24" Location/Qualifiers gap of /chromosome="12g" 41283: 174107: 67560: 175152: 77680: 12018: 44864: 67460: 111918: 44764: 59103: 175152 74007 111919 128203 174008 174108 41384 144865 59104 source BASE COUNT FEATURES ORIGIN

```
(VDE) (AAW09875), an enzyme that catalyses the despoxidation of violaxanthin to zeaxanthin and antheraxanthin. VDE nucleic acids (see also AAT66241, AAT66243), in sense or antisense orientation, can be used in genetic constructs, pref. also contg. a plastid translocation sequence, to modify VDE levels in plants. Increased therefore more productive and/or more resistant to disease. Underexpression of VDE increases photosynthetic efficiency under ornamentals can be modified.
                                                                                                                                                                                      cDNA clone (AAT66242) codes for tobacco violaxanthin de-epoxidase
                                                                                                  DNA encoding plant violaxanthin de-epoxidase - used to modify the

DNA encoding plant violaxanthin de-epoxidase - used to modify the sensitivity of a plant to light

Claim 3; Fig 1; 41pp; English.

C (VDE) (AAW09874) of romaine lettuce. VDE was purified from romaine lettuce chloroplasts and 2 tryptic peptides were used to develop primers (see also AAT66244-45), which amplified a partial VDE sequence. The amplified sequence was then used to screen a lettuce CDNA library, and the 1981 bp DNA sequence was identified. VDE nucleic acids (see also AAT66242-43), in sense or antisense orientation, can be used in genetic constructs, pref. also contg. a plastid translocation sequence, to modify VDE levels in plants. Increased levels result in the plant being tolerant of increased light and therefore more productive and/or more resistant to disease. Underexpression of VDE increases photosynthetic efficiency under low light. The photosensitivity of a range of crops, trees and ornamentals can be modified.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   de-epoxidate (VDE) (AAM)09876), an enzyme that catalyses the de-epoxidation of violaxanthin to zeaxanthin and antheraxanthin. WDE nucleic acids (see also AAT66241-42), in sense or antisense orientation, can be used in genetic constructs, pref. also contg. plastid translocation sequence, to modify VDE levels in plants. Increased levels result in the plant being tolerant of increased light and therefore more productive and/or more resistant to efficiency under row inght. The photosensitivity of a range of crops, trees and ornamentals can be modified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA encoding plant violaxanthin de-epoxidase - used to modify the

                              Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       979 atattttgtcatccaaagtagaaaatagtccagaggattacatatttgtgtgtactataagg 1038
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          799 aattgcatgagttccatacagaagaaaacaaacttgtggggaatttatcttggagaatac 858

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1519 tgtatttgattcttttgcctggaatagattgcttatacatcatgtattgcttcttttca 1578
                                                            The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1099 tgcctgaaaagcattataccggagttgcaaaccgcagctcaaaaagttgggcgtgatttca 1158
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      859 gtacacctgatggaggattttttactcgatcagcggtgcaaaaattcgtgcaagatccaa 918

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 186 жжжжжжжжжжжжжжжжжж 245
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             814 atacagaagaaaacaaacttgtggggaatttatcttggagaatacgtaccctgatggag 873

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       gagataaagaagtcaccttattcagtaaactgtttgaaggtttaaagagctccaacgag 1353
                                                                                                                                                                                                                                                                         The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                814 atacagaagaaaacaaacttgtggggaatttatcttggagaatacgtacacctgatggag 873
                                                                                                                                          acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nuclectide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

/note="Vector: pBluescript II SK+; Site_I: ECORI; Site_2:
XhoI; The cDNA library was constructed from mRNA isolated
from germinating shoots of 3 day old seedling for the
cultivar Williams B2. The seedlings were germinated in
growth chamber using germination paper in a solution
containing 100ppm auxin. Complementary DNA was synthesized
from mRNA using a primer consisting of a poly(dT) sequence
with a XhoI restriction site. EcoRI adapters were ligated
to the blunt-ended cDNA fragments followed by XhoI
digestion. The cDNA fragments were directionally cloned
into the EcoRI XhoI restriction site of the pBluescript
vector. The ligated cDNA fragments were transformed into
DH10B host cells (GibcoBRL). This library was constructed
in the laboratory of Dr. Randy Shoemaker."

/note—"Vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not; Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light eyrole, half on 16 hr light, 8 hour dark rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed CDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Genes galore: a summary of methods for accessing results from
large-scale partial sequencing of anonymous Arabidopsis cDNA clones
Plant Physiol. 106, 1241-1255 (1994)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 (bases 1 to 438)

/note="Wector: pBACIndigo; Site_1: ECORI; Site_2: ECORI;
Rice is the most important food crop in the world. Half of
the world population, especially those inhabiting highly
populated areas of the humid tropics and subtropics, rely
on rice as their primary source of carbohydrate.
Monocotyledonous rice is a diploid plant (2n=24) with a
haploid genome equivalent of 411 Mbp (Arumuganathan and
Earle, 1991). The relatively small genome of rice, three
times larger than that of Arabidopsis, makes it suitable
for genomic studies. In order to facilitate positional
cloning, physical mapping and genome sequencing of rice,
we have constructed a BAC library from Oryza sativa,
Nipponbare variety using EcoRI as the cloning enzyme. The
library contains 55,296 clones with an average insert size
of 121 Kb providing approximatley 15 haploid genome
equivalents. The deep coverage allows the isolation a
particular sequence with a probability of 99.9 %. Three
high density filters, each containing 18,432 clones
(doubly spotted), represent the whole library for colony
screening and can be requested from the Clemson University
BAC/EST Resource Center (www.genome.clemson.edu)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tactogoggtttgaatcccacttttgatgcttttgattgccaattgcatgagttccatac 817

The 55 kDa violaxanthin de-epoxidase (VDE) (AAW09875) of tobacco catalyses the de-epoxidation of violaxanthin to zeaxanthin and antheraxanthin. This system, termed energy dependent non-radiative energy dissipation or non-photochemical fluorescence quenching, reduces the quantum efficiency of photosystem II (PSII), helping to prevent PSII over-reduction and photoinhibitory damage. The amino cid sequence of the VDE madeled from an isolated cDNA clone (AAT66242). VDE nucleic acids (see also AAT66241, AAT66243), in sense modify VDE nucleic acids (see also AAT66241, AAT66243), in sense modify VDE levels in plants. Increased levels result in the plant and/or more resistant to disease. Underexpression of VDE increases photosynthetic efficiency under low light. The photosensitivity of a range of crops, trees and ornamentals can be modified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     in sense

The 55 kDa violaxanthin de-epoxidase (VDE) (AAW09874) of romaine lettuce catalyses the de-epoxidation of violaxanthin to zeaxanthin and antheraxanthin. This system, termed energy dependent con-radiative energy dissipation or non-photochemical fluorescence con-radiative and photosystem II (PSII) chelping to prevent PSII over-reduction and photochinhibitory damage. The amino acid sequence of the VDE was deduced from an isolated con-photosystem of the VDE nucleic acids (see also AAT66242-43), in sense or antisense orientation, can be used in genetic constructs to modify VDE levels in plants. Increased levels result in the photosynthetic efficiency under low light. The photosensitivity of a range of crops, trees and ornamentals can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    encoding plant violaxanthin de-epoxidase - used to modify the
